Abstract

Aerial surveys are vital to assessing animal populations as part of an effort to understand ecosystem health, a primary component of social and economic development in rural regions of Africa. This paper describes the design, deployment and preliminary performance results of a mobile application that provides visual real-time feedback to assist cockpit crews conducting aerial surveys.

Introduction

This poster introduces a system that assisted in surveys for the Great Elephant Census. It is based on a 7" Android tablet, which integrates with a laser altimeter mounted externally on the survey aircraft. It provides a point of data fusion, using the built in sensors on the tablet to determine airspeed and location, and display the various pieces of information in one place.

Goals

- Provide meaningful cockpit information to assist in survey navigation.
- Reduce the cognitive load of the FSO, who oversees the operation of the aerial surveys.
- Increase the accuracy of aerial surveys.
- Minimize build costs.
